

The graph plots the topological index (Y-axis, ranging from 0 to 1) against the layer number (X-axis, ranging from 0 to 35). The data is divided into three regions by vertical gray shading: Region 1 (Layers 0-22), Region 2 (Layers 23-26), and Region 3 (Layers 27-35). Four models are compared: L1 (blue), L2 (green), L3 (yellow), and L4 (purple). Solid lines represent the topological index, while dashed lines represent the topological index with a specific parameter (likely α). In Region 1, all models maintain a high topological index near 1.0. In Region 2, there is a sharp drop in the topological index for all models, reaching a minimum around Layer 24. In Region 3, the topological index increases again, with L4 (purple) showing the highest values and L3 (yellow) showing the lowest values.
